IMF BALI-FINTECH 2018

The IMF has recently (7th September 2018) given the nod to countries developing emerging Financial Technologies (Fintech) providing 12 guidelines to encourage how these should be implemented. Innovations like Split Velocity and wealth creation are guided by this IMF description and its guidelines. A financial technology that meets these conditions set in the IMF Bali-Fintech guidelines can be considered for implementation by governments through the central bank and finance ministry.

Innovations in financial technologies are the future when it comes to growth and development. The Bali-Fintech document can be used to guide new strategies that nurture growth and development using financial technologies.

Helping your central bank accelerate **Economic**

Growth

...#End poverty

Economic growth with stability.

Commercial banks can operate with lower economic risk across the world

COMMERCIAL BANKS THRIVE..

By far one of the most progressive advantages of split velocity is the ability of commercial banks to issue loans at lower cost. In this new and more efficient model the public can borrow money without any interest charges, however, commercial banks' earnings improve significantly. This is achieved by applying split velocity to credit creation. Accelerating credit at constant price will allow banks to become more robust, become more profitable and issue credit at much lower risk. This will allow central banks to meaningfully improve credit creation and the quality of related services .

The truth is that no government in the world today should be operating in an economy where growth is zero growth; where the economy functions in direct conflict with businesses. This is far too close to the edge and precipice of economic failure, the danger of recession becomes ever-present and the risk factor within every economy becomes too high due to volatility entails that a domestic and/or global recession is always potentially about to occur and can be triggered by any adverse natural or man made economic condition that perseveres. Ideally, the lowest rate of growth

Businesses operate in an economy where they thrive

Correcting subtraction through augmented split velocity creates an economy in which businesses become more profitable. They experience higher levels of demand for their goods and services. An improved business environment enhance the overall vibrance of the economy.

The technology behind augmented split velocity directly breaks up scarcity below the circular flow of income thereby freeing financial resources .

for any country should be $R=2$ where 100% of the losses from subtraction are recovered and annual financing is equivalent to GDP as long as population growth rates maintain an equivalence with this rate of growth.

Having as much as 100% of the financial resources lost to subtraction recovered through Split Velocity is a tremendous buffer against risk that allows governments and the economies they manage to withstand diverse economic shocks.

Banking with lower risk

Wealth creation also significantly reduces the risk of default as a result of operating in an economy where what they do is being accelerated. A more robust and more stable economy allows commercial banks to issue more loans with much lower risk which may in turn allow them to provide loans with less of a dependence on collateral.

In essence borrowing becomes more affordable flanked by businesses taking on bigger and more ambitious investments in the country.

Our technology changes the architecture of finance..
The ability to issue loans with no interest but greater profitability,
Innovation that works for you..

Impossible is Nothing.....

An innovative solution for Commercial Banks & Non-bank institutions

Wealth creation consulting provides a total end to end solution

An increases demand for loans

Wealth creation generates tremendous financial resources equivalent to GDP that have a major impact on internal short term growth of businesses, however, these finances are so

widely dispersed businesses soon realize they have limited long term value. These finances are huge to the economy in general but small to individual businesses especially where their plans for long term growth are concerned. Consequently, their demand for loans from banks increases significantly.

Improvement in Credit Creation for Commercial Banks & Non-Bank Institutions

Split velocity is the only implementation-ready technology available today that is able to allow commercial banks to issue loans with no interest and yet enable commercial banks to earn significantly more than they did when they charged interest. In fact, a great deal more than when they charged interest.

Wealth creation is the missing link in financial services

There is an indispensable financial service missing from the portfolio of services on offer. That missing service is wealth creation.

Wealth creation and credit creation are a perfect fit and work hand in glove to improve the services banks offer. In this new and more efficient model commercial banks' earnings improve significantly allowing them to improve the credit support services they offer their clients. This is achieved by applying Split Velocity to credit creation.

Accelerating credit at constant price will allow banks and non-banks issuing loans to become more robust, become more profitable, innovative and issue credit at much lower risk. They will be able to offer their clients services they could not provide before.
